# Introduction to Machine Learning

Hyperparameter Tuning - Pipelines and AutoML

Learning goals

- Pipelines as connected steps of learnable operations
- Sequential pipeline
- Pipelines and DAGs

CASE FOR AUTOML

- More and more tasks are approached via data driven methods.
- Data scientists often rely on trial-and-error.
- The process is especially tedious for similar, recurring tasks.
- Not the entire machine learning lifecycle can be automated.

The Machine Learning Lifecycle
PIPELINES AND AUTOML

- ML typically has several data transformation steps before model fit
- If steps are in succession, data flows through sequential pipeline
- NB: Each node has a train and predict step and learns params
- And usually has HPs

Pipelines are required to embed full model building into CV to avoid overfitting and biased evaluation!

PIPELINES AND AUTOML

- Further flexibility by representing pipeline as DAG
- Single source accepts $\mathcal{D}_{\text{train}}$, single sink returns predictions
- Each node represents a preprocessing operation, a learner, a postprocessing operation or controls data flow
- Can be used to implement ensembles, operator selection, ...
PIPELINES AND AUTOML

- HPs of pipeline are the joint set of all HPs of its contained nodes:
  $$\tilde{\boldsymbol{\Lambda}} = \tilde{\boldsymbol{\Lambda}}_{\mathrm{op},1} \times \cdots \times \tilde{\boldsymbol{\Lambda}}_{\mathrm{op},k} \times \tilde{\boldsymbol{\Lambda}}_{\mathcal{I}}$$
- HP space of a DAG is more complex: Depending on branching / selection different nodes and HPs are active
  → **hierarchical search space**

$\boxed{\text{Search Space } \tilde{\Lambda}}$			
Name	Type	Bounds/Values	Trafo
encoding	C	one-hot, impact	
◇ pca	C	PCA, no PCA	
◇ learner	C	glmnet, SVM,	
		Boosting	
if learner = glmnet			
s	R	$[-12, 12]$	2^x
alpha	R	$[0, 1]$	–
if learner = SVM			
cost	R	$[-12, 12]$	2^x
gamma	R	$[-12, 12]$	2^x
if learner = Boosting			
eta	R	$[-4, 0]$	10^x
nrounds	I	$\{1, \ldots, 5000\}$	–
max_depth	I	$\{1, \ldots, 20\}$	–
A graph that includes many preprocessing steps and learner types can be flexible enough to work on a large number of data sets

Combining such graph with an efficient tuner is key in AutoML

AUTOML – CHALLENGES

- Most efficient approach?
- How to integrate human a-priori knowledge?
- How can we best (computationally) transfer "experience" into AutoML? Warmstarts, learned search spaces, etc.
- Multi-Objective goals, including model intepretability
- AutoML as a process is too much of a black-box, hurts adoption.
